

Nature Notes

Sprint 2

Team 5

Will Hedges

Ruth Higgason

Benjamin Kozlowski

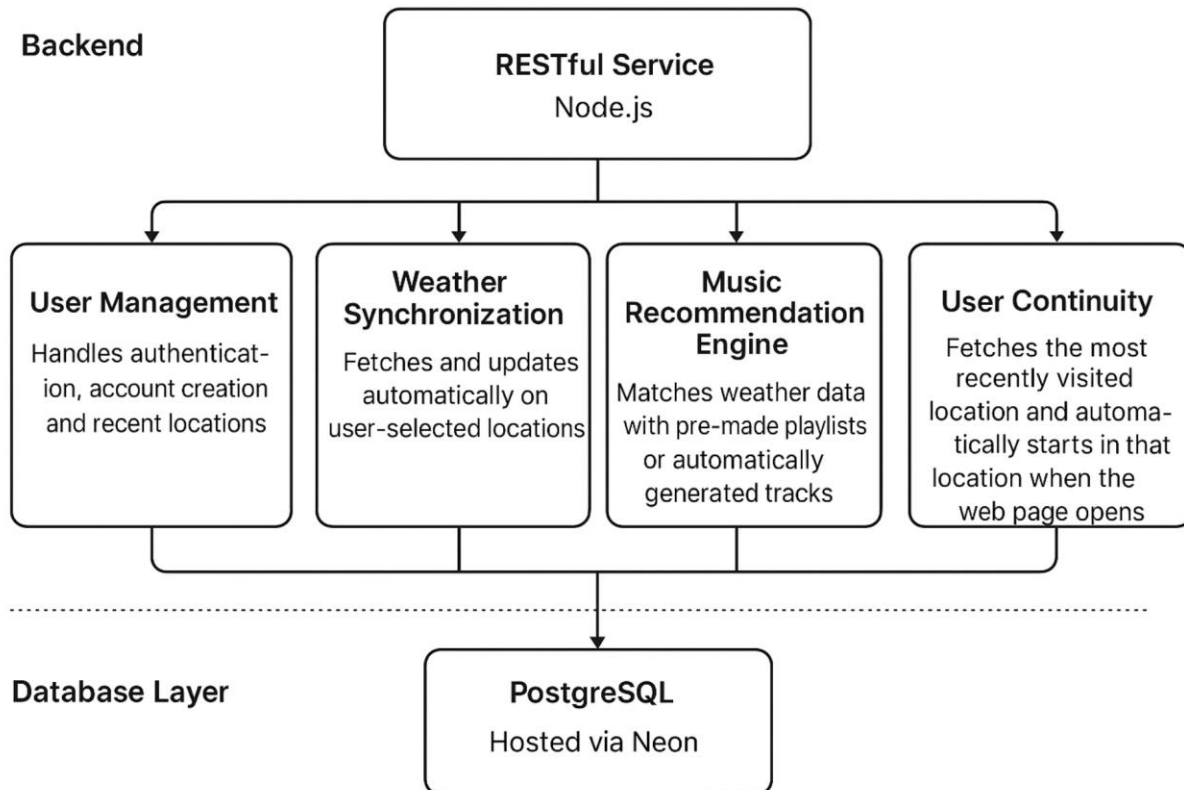

Eric Loseke

MJ McGee

Architecture Description

For sprint 2 the remaining components for the project are completed, namely the database and the backend. The major elements of the project are completed, and now focus can be set on polishing and adding new features to the website.

UML Diagram for Sprint 2

1. Backend Architecture

Business logic, user account management and data security are handled in the backend layer. The idea is to have a RESTful service, using Node.js.

Key backend roles:

- **User Management:** Handles authentication, account creation, and, recent locations.
- **Weather Synchronization:** It fetches and updates automatically on the user-selected locations.
- **Music Recommendation Engine:** This matches weather data with pre-made playlists or automatically generated tracks.

- **User continuity:** Fetches the most recently visited location and automatically starts in that location when the web page opens.

2. Database Layer

Database PostgreSQL hosted via Neon, providing a cloud relational database. The schema includes tables for:

- Users and authentication information
- Most recently searched locations

Conclusion

This architecture uses PostgreSQL for the database and Node.js for the website backend. With the completion of this sprint, the project is now in a minimum viable state. Sprints 3 and 4 will now be focused on polishing features already added or adding new features to the project.
