

Project Release Document

Overview

This release introduces several user-facing enhancements and playback features for the application. The work focuses on expanding user control, improving accessibility through alternative modes, and enhancing overall user interface quality.

Completed Features

1. Offline Mode

Implemented an offline mode allowing users to select music manually rather than relying on weather-based data. This enables playback when network or API access is unavailable and gives users more direct control over their listening experience.

2. Location Selection Enhancements

- **Globe-style Location Selector (8.1):** Added an interactive globe interface enabling users to choose locations visually, improving engagement and ease of navigation.
- **Randomized Location Selector (8.2):** Introduced an option to randomly select a location, offering a more dynamic and exploratory experience.

3. Music Playback Improvements

- **Fade-in/Fade-out (9):** Implemented smooth audio transitions to enhance the listening experience and reduce abrupt stops or starts.

Partially Completed Features

4. Scrub Bar and Playback Speed (9.1)

Functionality for the music scrub bar and playback speed adjustment was started but not completed in this release. These capabilities remain planned for a future update.

UI Improvements (10)

Front-page UI enhancements were implemented using Lottie animation files. Added animated effects representing:

- Snow
- Rain
- Clouds
- Fog

These environmental animations deliver a more immersive and visually appealing interface.

Pending Work

- Finalize the scrub bar functionality.
- Implement playback speed controls.
- Additional UI refinement

Summary

This release significantly enhances user choice, visual experience, and audio smoothness while laying the groundwork for upcoming playback controls. The remaining features will be completed in a future milestone.
