Architecture Description

Sprint 3 is spent polishing and expanding the functionality of Nature Notes. These changes consist of adding a music only mode, updating UI, adding animated elements, adding a random location button, linking scrub bar to music, adding transitions between songs, allowing users to view the playlist in use, and allowing users to select a location from an interactive globe map. By the end of sprint 3, most of these elements should be functional or close to functional.

1. Front-end Architecture

- Extend existing component structure to include:
 - **Updated Music Player Component** (transitions, playlist view, user music selection).
 - **RandomLocationButton Component** with asynchronous event handling.
 - **GlobeSelector Component** that emits coordinates back to the main controller.
 - **Animations in weather card** that play according to associated weather effect

2. Backend Architecture

- Ensure weather-fetching and playlist-generation logic supports:
 - input from globe coordinates

3. Dependencies & Integration Notes

- Use lottie-react for weather animations
- Globe component uses pre-existing globe-react library

Conclusion

The product is close to completion, with all required features being added and all elements being polished. The product will mostly be tested during the final sprint, primarily to touch up any overlooked edge cases and to fix up any
