Document Specifications

1.1 Purpose

The following document describes and defines both the functional and non-functional requirements of the Nature Notes web app, to be implemented in Sprint 2.

1.2 Scope

The scope of Sprint 2 encompasses the goals such as the creation of a Postgres SQL database for the purpose of storing user authentication information and personalized data such as recently searched locations. Sprint 2 also aims to streamline the data fetching of weather, such as loading recent locations upon sign in. Backend logic will be introduced to maintain this data as well as security measures to maintain data privacy.

2 Functional Requirements

ID	Requirement Description
<i>FR 1</i>	The website shall be connected to a Postgres SQL database hosted on Neon, which will store user authentication information as well as recent user data.
<i>FR 2</i>	The website shall use its connection to the database to verify user identity.
<i>FR 3</i>	The website shall load the user's 3 most recent searched for locations upon log in.
<i>FR 4</i>	The website shall automatically fetch the weather data of the most recently searched location and ready the music pertaining to be played.
<i>FR 5</i>	The website's home page shall be made up of different components which act independently.

3 Non-Functional Requirements

ID	Requirement Description
<i>NFR 1</i>	The User Interface of the website shall be updated to look better and provide an easier time to the user.
<i>NFR 2</i>	The data stored by the website shall be kept private and secure.
<i>NFR 3</i>	The website shall not experience excess lag while fetching data or playing music.
