

Agile Reference Stories Table

Reference Story #	Pool	Story Source	Story Summary
1	1	EECS 581 Minesweeper	Provide a status indicator (e.g. "Playing", "Game Over: Loss", to inform the user of the current state of the game. This indicator should be clearly visible on the game interface and update dynamically as the game progresses or reaches a conclusion.
2	1	EECS 581 Minesweeper	Create start screen, victory screen on the front page, this involved creating new objects which would draw over the screen to show the new screen
3	1	EECS 581 Minesweeper	Make it so you can not uncover a cell in between the mines being revealed and the Game Over screen being displayed. This prevents broken states of incorrect counts.
4	1	EECS 581 Minesweeper	Implementing flag count to accurately count how many mines have not been found. Making it decrease by one when a flag is placed and adding one to the flag count when a flag is taken off the board.
5	2	EECS 268 Programming 2	Implemented a maze solving algorithm which could solve given mazes by utilizing multiple different solution strategies, such as left wall following, breadth first search, and depth first search.
6	2	EECS 581 Minesweeper	Implement StartScreen and Button classes; refactor GameApp to integrate StartScreen. This involved creating a reusable button called button.py that could be placed on the home screen.
7	2	EECS 581 Minesweeper	Detect when a user clicks on the screen, whether it was a left click or a right click, and what element they have clicked on
8	2	EECS 581 Minesweeper	Manage game state transitions between initial condition, playing condition, first mine placed condition,

			and winning condition.
9	3	EECS 581 Minesweeper	Create an initial cell.py class with properties that showed the state of each cell such as if it was a mine, if it was revealed, if it was flagged, etc.
10	3	EECS 690 IC	Implement Video Game UI for navigating from home screen to the beginning of the game. It also includes buttons for options. It provided an explanation of what the player should expect by the upcoming game.
11	3	EECS 581 Minesweeper Maintenance	Create an initial AI module to alternate between player and AI with Easy difficulty: the computer clicks on any hidden cell at random.
12	3	ECS 581 Minesweeper Maintenance	AI Solver Medium difficulty: computer applies two basic rules: if the number of hidden neighbors equals the cell's number, flag all hidden neighbors. If the number of flagged neighbors equals the cell's number, open all hidden neighbors. If no rule applies, pick a random hidden cell.
13	3	EECS 581 Minesweeper Maintenance	Created a helper function to return the cells orthogonal to the given cell. The cells were in clockwise order, with None representing where the cell bordered the edge of the grid.
14	5	EECS 581 Minesweeper Maintenance	AI Solver Hard difficulty: Computer applies all Medium rules plus the 1-2-1 pattern rule: If three side-by-side revealed cells show "1-2-1," then the two outer hidden neighbors are mines (flag them), and the inner hidden neighbor is safe (open it). If no rule applies, pick a random hidden cell.
15	5	EE CS 581 Minesweeper Maintenance	Source and implement music and sound effects from an unused library that was initially meant to be used for another project and repurposed.
16	5	EECS 348 C++ Calculator	Implement addition through token parsing, as well as implementing the subtraction of floating point numbers

			done for the calculator.
17	8	EECS 678 Quash	Implement echo command, which would function by taking the input from the user or another function and writing it
18	8	EECS 678 Quash	Run executables without arguments. This involved using the exec command so that way basic commands could be run that were built in to the terminal through this system call.
19	8	EECS 348 C++ Calculator	Implement Division and multiplication, by doing parsing. This is more difficult because it involves order of operations where there is PEMDAS applies where division is done before addition
20	8	EECS 678 Quash	Implement cd command where the using can search for a file based on the name. This also includes the ability to perform the backup command like cd .. This allows the user to navigate their filesystem.
21	13	EECS 678 Quash	Implement file redirection, this allows for writing into one file to another and even writing out to the screen by redirecting the file input out to the print screen.
22	13	EECS 678 Quash	Implement background process feature using the & sign to have the process run while the foreground process rounds. This also includes the ability to print the pids of the currently active processes
23	13	EECS 678 Quash	Create pipes, this involved moving input from one section to the other so that way we can connect multiple objects.
24	13	EECS 678	Implement printing of variables from the terminal that includes an addition to the basic echo command where this will be able to print system variables
